1. Consider a collision between a small car and a heavy truck. In such a collision, how does the size of the force exerted on the car by the truck compare with the size of the force exerted on the truck by the car? Explain your reasoning.

## Car

Truck

2. a. Draw a velocity-time graph for a ball thrown vertically into the air during its up-and-down motion.
b. Draw a force diagram for the thrown ball when it reaches its highest point.

| c. At the highest point, is the velocity zero? <br> Explain. | d. At the highest point, is the acceleration zero? <br> Explain. |
| :--- | :--- |
|  |  |

e. At the highest point, is the net force zero (i.e. are the forces unbalanced)? Explain how you know.
4. You push a grocery cart along a level floor in the presence of friction effects between the cart and the floor.
a. Draw force diagrams for you, the cart, and the floor/earth. Fully label all vectors. Connect any $3^{\text {rd }}$ Law Paired Forces

## Shopper

## Cart

## Floor/Earth

b. While you are making the cart speed up, how does the size of the force you apply on the cart compare to the size of the force the cart exerts on you? Explain.
c. While you are making the cart speed up, how does the size of the frictional force on the cart by the floor compare to the frictional force on you by the floor?
d. Identify all of the Newton's Third Law pairs in your force diagrams. List the pairs below.
5. A 35 kg child pulls a 10 kg wagon up a hill at $0.6 \mathrm{~m} / \mathrm{s}$. The wagon exerts 60 N of force on the child.
a. Draw a quantitative (Hint numbers should be involved...) force diagram for the wagon.

b. Explain how you applied Newton's second law to make the force diagram quantitative.
c. Explain how you applied Newton's third law to make the force diagram quantitative.
6. Mr. Ed the talking horse is being hitched to a cart. He refuses to pull the cart due to his understanding of Newton's Third Law. He believes that if he pulls on the cart there is an equal but opposite force that will keep the cart from moving. How do you reason with him? Draw force diagrams to prove your point.

Unit 5
For each problem draw a picture, a force diagram, list the known and unknowns, show your work, and use units!

1. An 80 kg water skier is being pulled by a boat with a force of 220 N causing the skier to accelerate at $1.8 \mathrm{~N} / \mathrm{kg}$. Find the drag force by the water on the skier.
2. A 2000 kg car is slowed down uniformly from $20 \mathrm{~m} / \mathrm{s}$ to $5 \mathrm{~m} / \mathrm{s}$ in 4 seconds, this gives the car an acceleration of $-3.75 \mathrm{~N} / \mathrm{kg}$. Determine the average net force on the car during this time, and sketch a Velocity vs time graph find the displacement of the car during this time from your graph.
3. A 15.0 kg block is allowed to slide down a ramp with $\mu_{\mathrm{k}}=0.20 . \mathrm{F}_{f}=\mu_{\mathrm{k}} * \mathrm{~F}_{\mathrm{N}}$

a. What is the value of the frictional force opposing the block's slide down the ramp?
b. What is the acceleration of the block?
4. In the diagram to the right, the cord makes a $25^{\circ}$ angle with the horizontal, the mass of the sled and occupants is 100 kg . The tension in the cord is 120 N and the friction force is 15 N . Find the acceleration of the sled.

5. The 60 kg skier shown below is skiing down a $35^{\circ}$ incline with a coefficient of friction $\left(\mu_{\mathrm{k}}\right)$ is 0.08 . Determine the acceleration of the skier. $\mathrm{F}_{f}=\mu_{\mathrm{k}} * \mathrm{~F}_{\mathrm{N}}$
