| $\tan \theta$ | 0 | $\sqrt{3} / 3$ | $3 / 4$ | 1 | $4 / 3$ | $\sqrt{3}$ | $\infty$ |  |  |

The following assumptions are used in this exam.
I. The frame of reference of any problem is inertial unless otherwise stated.
II. The direction of current is the direction in which positive charges would drift.
III. The electric potential is zero at an infinite distance from an isolated point charge.
IV. All batteries and meters are ideal unless otherwise stated.
V. Edge effects for the electric field of a parallel plate capacitor are negligible unless otherwise stated.

# PHYSICS C: ELECTRICITY AND MAGNETISM <br> SECTION II <br> Time- 45 minutes <br> 3 Questions 

Directions: Answer all three questions. The suggested time is about 15 minutes for answering each of the questions, which are worth 15 points each. The parts within a question may not have equal weight. Show all your work in this booklet in the spaces provided after each part.

E\&M.1.
Two point charges, $q_{1}$ and $q_{2}$, are fixed in place on the $x$-axis at positions $x_{1}=-1.00 \mathrm{~m}$ and $x_{2}=+0.50 \mathrm{~m}$, respectively. Charge $q_{2}$ has a value of +2.0 nC . Values of electric potential are illustrated by the given equipotentials in the diagram shown above, which is drawn to scale.
(a) Calculate the value of $q_{1}$.
(b) At point C on the diagram, draw a vector representing the direction of the electric field at that point.
(c) Calculate the approximate magnitude of the electric field strength at point D on the diagram.
(d) The equipotential labeled 0 V is the cross section of a nearly spherical surface. Calculate the electric flux for this surface.

## 2016 AP ${ }^{\circledR}$ PHYSICS C: ELECTRICITY AND MAGNETISM FREE-RESPONSE OUESTIONS

(e) A proton is placed at point A and then released from rest.
i. Calculate the work done by the electric field on the proton as it moves from point $A$ to point $E$.
ii. Calculate the speed of the proton when it reaches point $E$.
(f) An electron is released from rest at point B. Which of the following indicates the direction of the initial acceleration, if any, of the electron?
$\qquad$
Up Down
___ Left
Into the page
Right

The direction is undefined since the acceleration is zero
Justify your answer.

## E\&M.2.

The circuit shown above consists of a source of variable emf $\mathcal{E}$, an ideal ammeter A , an ideal voltmeter V , a resistor of resistance $R$, and a sample of wire with resistance $r$.
(a) How does the current through the wire sample compare with the current through the resistor $R$ ?
$\qquad$ It is greater through $R$. $\qquad$ It is greater through the sample.
$\qquad$ It is the same through both. $\qquad$ It depends on the resistance of the sample.

Justify your answer.
(b) How does the potential difference across the wire sample compare with the potential difference across the resistor $R$ ?
$\qquad$ It is greater across $R$. $\qquad$ It is greater across the sample.
$\qquad$ It is the same across both. $\qquad$ It depends on the resistance of the sample.

Justify your answer.
With the sample of wire in place, the emf of the source is set to a given value. The current through and potential difference across the resistor $R$ are measured. This is repeated for several values of emf, and the data are recorded in the table below.

| $\varepsilon(\mathrm{V})$ | $V_{R}(\mathrm{~V})$ | $I_{R}(\mathrm{~A})$ |  |  |
| :--- | :--- | :--- | :--- | :--- |
| 0.250 | 0.179 | 0.162 |  |  |
| 0.500 | 0.335 | 0.327 |  |  |
| 0.750 | 0.520 | 0.490 |  |  |
| 1.000 | 0.670 | 0.687 |  |  |

(c) Indicate below which quantities should be graphed to yield a straight line that could be used to calculate a numerical value for the resistance of the wire sample.
Horizontal axis: $\qquad$
Vertical axis: $\qquad$
You may use the remaining columns in the table above, as needed, to record any quantities that you indicated that are not given.
(d) On the grid below, plot the straight line data points from part (c). Clearly scale and label all axes, including units if appropriate. Draw a straight line that best represents the data.

(e) Use your straight line to calculate the value of the resistance of the wire sample.
(f) The wire sample has a length of 3.00 m and a radius of $1.00 \times 10^{-3} \mathrm{~m}$. Calculate the resistivity of the material from which the wire sample is made.
(g)
i. Suppose the ammeter used to collect these data was not ideal. Would the actual value of the resistance of the wire sample be greater than, less than, or equal to that calculated in part (e) ?
$\qquad$ Greater than $\qquad$ Less than $\qquad$ Equal to
Justify your answer.
ii. If the ideal voltmeter is replaced by a voltmeter that is not ideal and the experiment is repeated, would the readings of the ideal ammeter be greater than, less than, or equal to those in the data chart before part (c) ?
$\qquad$ Greater than $\qquad$ Less than $\qquad$ Equal to
Justify your answer.

E\&M.3.
A conducting bar of mass $M$, length $L$, and negligible resistance is connected to two long vertical conducting rails of negligible resistance. The two rails are connected by a resistor of resistance $R$ at the top. The entire apparatus is located in a magnetic field of magnitude $B$ directed into the page, as shown in the figure above. The bar is released from rest and slides without friction down the rails.
(a) What is the direction of the current in the resistor?
$\qquad$ Left $\qquad$ Right
(b)
i. Is the magnitude of the net magnetic field above the bar at point $C$ greater than, less than, or equal to the magnitude of the net magnetic field before the bar is released?
$\qquad$ Greater than $\qquad$ Less than $\qquad$ Equal to
Justify your answer.
ii. While the bar is above point D , is the magnitude of the net magnetic field at point $D$ greater than, less than, or equal to the magnitude of the net magnetic field before the bar is released?
$\qquad$ Greater than $\qquad$ Less than $\qquad$ Equal to

## Justify your answer.

Express your answers to parts (c) and (d) in terms of $M, L, R, B$, and physical constants, as appropriate.
(c) Write, but do NOT solve, a differential equation that could be used to determine the velocity of the falling bar as a function of time $t$.
(d) Determine an expression for the terminal velocity $v_{T}$ of the bar.

Express your answers to parts (e) and (f) in terms of $v_{T}, M, L, R, B$, and physical constants, as appropriate.
(e) Derive an expression for the power dissipated in the resistor when the bar is falling at terminal velocity.
(f) Using your differential equation from part (c), derive an expression for the speed of the falling bar $v(t)$ as a function of time $t$.

## STOP <br> END OF EXAM
